Título: Improving Firefox Stability in the Enterprise by Reducing DLL Injection
Resumen: Beginning in version 138, Firefox will offer an alternative to DLL injection for Data Loss Prevention (DLP) deployments in enterprise environments. DLL Injection DLL injection into Firefox is a topic we've covered on the Hacks blog before. In 2023, we blogged about the Firefox capability to let users block third-party DLLs from being loaded. We […]

Artículo 42
Título: Improved Process Isolation in Firefox 100
Resumen: Firefox uses a multi-process model for additional security and stability while browsing: Web Content (such as HTML/CSS and Javascript) is rendered in separate processes that are isolated from the rest of the operating system and managed by a privileged parent process. This way, the amount of control gained by an attacker that exploits a bug in a content process is limited. In this article, we would like to dive a bit further into the latest major milestone we have reached: Win32k Lockdown, which greatly reduces the capabilities of the content process when running on Windows.

Título: Common Voice dataset tops 20,000 hours
Resumen: The latest Common Voice dataset, released today, has achieved a major milestone: More than 20,000 hours of open-source speech data that anyone, anywhere can use. The dataset has nearly doubled in the past year. Mozilla's Common Voice seeks to change the language technology ecosystem by supporting communities to collect voice data for the creation of voice-enabled applications for their own languages.

Artículo 50

Título: Announcing Interop 2022
Resumen: Writing high quality standards is a necessary first step to an interoperable web platform, but ensuring that browsers are consistent in their behavior requires an ongoing process. Browsers must work to ensure that they have a shared understanding of web standards, and that their implementation matches that understanding. Interop 2022 is a cross-browser initiative to find and address the most important interoperability pain points on the web platform. The end result is a public metric that will assess progress toward fixing these interoperability issues.

Artículo 62

Título: Implementing form filling and accessibility in the Firefox PDF viewer
Resumen: Last year, during lockdown, many discovered the importance of PDF forms when having to deal remotely with administrations and large organizations like banks. Firefox supported displaying PDF forms, but it didn't support filling them: users had to print them, fill them by hand, and scan them back to digital form. We decided it was time to reinvest in the PDF viewer (PDF.js) and support filling PDF forms within Firefox to make our users' lives easier.

Título: In March, we see Firefox 87
Resumen: Nearing the end of March now, and we have a new version of Firefox ready to deliver some interesting new features to your door. This month, we've got some rather nice DevTools additions in the form of prefers-color-scheme media query emulation and toggling :target pseudo-classes, some very useful additions to editable DOM elements: the beforeinput event and getTargetRanges() method, and some nice security, privacy, and macOS screenreader support updates.

Artículo 83

Título: How MDN's site-search works
Resumen: Periodically, the whole of MDN is built, by our Node code , in a GitHub Action. A Python script bulk-publishes this to Elasticsearch. Our Django server queries the same Elasticsearch via /api/v1/search. The site-search page is a static single-page app that sends XHR requests to the /api/v1/search endpoint. Search results' sort-order is determined by match and "popularity".

Artículo 88

Título: Browser fuzzing at Mozilla

Resumen: Mozilla has been fuzzing Firefox and its underlying components for a while. It has proven itself to be one of the most efficient ways to identify quality and security issues. In general, we apply fuzzing on different levels: there is fuzzing the browser as a whole but a significant amount of time is also spent on fuzzing isolated code (e.g. with libFuzzer) or even whole components such as the JS engine using separate shells with various fuzzers. For the purpose of this blog post, we will talk specifically about browser fuzzing only, and go into detail on the pipeline we've developed.

Artículo 114
Título: Testing Firefox more efficiently with machine learning
Resumen: A browser is an enormously complex piece of software, and it's always in development. About a year ago, we asked ourselves: how could we do better? Our CI relied heavily on human intervention. What if we could instead correlate patches to tests using historical regression data? Could we use a machine learning algorithm to figure out the optimal set of tests to run? We hypothesized that we could run fewer tests to save money, get results faster, and reduce the cognitive burden on developers.

Título: Introducing the MDN Web Docs Front-end developer learning pathway
Resumen: The MDN Web Docs Learning Area teaches fundamentals of modern web development, beginning with HTML, CSS, and JavaScript essentials. In feedback this year, readers asked for a more opinionated, structured approach. They asked for coverage of client-side tooling, frameworks, transformation tools, and deployment tools widely used in today's workplace. Meet the Front-end developer learning pathway from MDN.

Artículo 125
Título: A New RegExp Engine in SpiderMonkey
Resumen: Regular expressions – commonly known as RegExps – are a powerful and
heavily used tool for manipulating strings in JavaScript. This post describes how we
updated the RegExp engine in SpiderMonkey, Firefox's JavaScript engine, by building a
shim layer to V8's Irregexp. The outcome: reduced maintenance and stronger
collaboration among the browsers, full support for all the new RegExp features, and
compatibility with the latest ECMAScript standard.

Artículo 148
Título: Securing Firefox with WebAssembly
Resumen: Protecting the security and privacy of individuals is a central tenet of Mozilla's mission. While we continue to make extensive use of both sandboxing and Rust in Firefox to address security challenges in the browser, each has its limitations. Today we're adding a third approach to our arsenal. RLBox, a new sandboxing technology developed by researchers at the University of California, San Diego, and the University of Texas, Austin, allows us to quickly and efficiently convert existing Firefox components to run inside a WebAssembly sandbox.

Título: Firefox 73 is upon us
Resumen: Today we've released Firefox 73, with useful additions that include CSS and JavaScript updates, and numerous DevTools improvements. We've added to CSS logical properties, pushed performance forward in the Console and the Debugger, and improved the WebSocket inspector. Thanks to all for the ongoing DevTools feedback.

Título: It's the Boot for TLS 1.0 and TLS 1.1
Resumen: The Transport Layer Security (TLS) protocol is the de facto means for establishing security on the Web. The newest version, TLS 1.3, improves efficiency and remedies the flaws and weaknesses present in earlier versions. In October 2018, we announced our plans regarding TLS 1.0 and TLS 1.1 deprecation. Now's the time for us to make this change together and move the TLS ecosystem forward.

Título: The Mozilla Developer Roadshow: Asia Tour Retrospective and 2020 Plans
Resumen: November 2019 was a busy month for the Mozilla Developer Roadshow, with stops in five Asian cities —Tokyo, Seoul, Taipei, Singapore, and Bangkok. Today, we're releasing a playlist of the talks presented in Asia, with subtitles available for all these talks in languages spoken in the countries on this tour: Japanese, Korean, Chinese, Thai, as well as English. We covered CSS Subgrid, Mixed Reality, Web Compatibility, and more.

Título: Using WebAssembly from .NET with Wasmtime

Resumen: Wasmtime, the WebAssembly runtime from the Bytecode Alliance, recently added an early preview of an API for .NET Core, Microsoft's free, open-source, and cross-platform application runtime. This API enables developers to programmatically load and execute WebAssembly code directly from .NET programs. Although .NET Core is already a cross-platform runtime, there are good reasons for .NET developers to take a closer look at WebAssembly, as Peter Huene demonstrates in this post.

Artículo 169
Título: The two-value syntax of the CSS Display property
Resumen: The display CSS property is how we change the formatting context of an
element and its children. One of the first things you will learn about CSS is that some
elements are block by default, and others are inline. The display property enables
switching between these states. With support currently available only in Firefox 70, it is
too early to start using these two-value properties in production. However, they are

important to be aware of, in terms of what they mean for CSS.

Artículo 189
Título: WebThings Gateway for Wireless Routers
Resumen: The Mozilla IoT team has been working on evolving WebThings Gateway into a full software distribution for consumer wireless routers. Today, with the 0.9 release, we're happy to announce the availability of the first experimental builds for our first target router hardware, the Turris Omnia. These builds are based on the open source OpenWrt operating system and feature a new first-time setup experience, which enables you to configure the gateway as a router and Wi-Fi access point itself.

Título: Web Design Survey Findings and Next Steps
Resumen: In November, I wrote about my team's work on experimental new web design
tools and introduced a survey to rank the challenges of web design and development.
The insights you shared continue to inform priorities for the Firefox DevTools' 2019
roadmap. Our main takeaway: developers and designers of every experience level want
a better understanding of CSS debugging. We're on it.

Artículo 229
Título: Firefox 66 to block automatically playing audible video and audio
Resumen: Unsolicited volume can be a great source of distraction and frustration for users of the web. So we are making changes to how Firefox handles playing media with sound and we want to make sure web developers are aware of this new audio autoplay blocking default. With the release of Firefox 66, now in Firefox Beta/Developer Edition, the browser will block audible audio and video, and will allow a site to play audio or video aloud via the HTMLMediaElement API only once the user has initiated the audio.

Artículo 272

Título: Dweb: Building Cooperation and Trust into the Web with IPFS
Resumen: The Interplanetary File System (IPFS) is a new protocol powered by individuals on the internet. Its goal is to "re-decentralize" the web by replacing location-oriented HTTP with a content-oriented protocol that allows websites and web apps to be "served" by any computer on the internet with IPFS support. IPFS and the distributed web decouple information from physical location and singular distribution, with the aim of creating a more affordable, available, and faster web for all.

Artículo 274
Título: Dweb: Serving the Web from the Browser with Beaker
Resumen: Publishing and sharing is core to the Web's ethos, yet to publish your own website or even just share a document, you need to know how to run a server, or be able to pay someone to do it for you. Peer-to-peer protocols like dat:// make it possible for regular user devices to host content, so Beaker uses dat:// to enable publishing from the browser, where instead of using a server, a website's author and its visitors help host its files. It's kind of like BitTorrent, but for websites!

Artículo 275
Título: Dweb: Building a Resilient Web with WebTorrent
Resumen: The web is healthy when the financial cost of self-expression isn't a barrier. This installment of the Dweb series describes WebTorrent – an implementation of the BitTorrent protocol that runs in a web browser. It's written completely in JavaScript – the language of the web – and uses WebRTC for true peer-to-peer transport. No browser plugin, extension, or installation is required. The distributed approach removes the cost of running centralized servers at data centers, allowing websites to scale sustainably.

Artículo 288

Título: Retained Display Lists for improved page performance
Resumen: Display list building is the process in which we collect the set of high-level items to display on screen (borders, backgrounds, text and much more), and then sort the list, according to CSS painting rules, into the correct back-to-front order. By retaining the display list and only reloading the assets that have changed since first paint, we are able to optimize painting performance especially for highly interactive pages. Look for this feature in this week's release of Firefox 61.

Artículo 305
Título: Build your own web things with the Things Framework
Resumen: Last year Mozilla started Project Things to help developers connect physical "things" to the web in a safe, secure and interoperable way. Now, with the 0.4 release of

the Things Gateway, you can add native web things to your gateway, to control them alongside all your other smart home devices. The advantage of native web things is that they don't need a custom gateway adapter because they follow a common standard using existing web technologies.

Título: What Makes a Great Extension?
Resumen: We're in the middle of our Firefox Quantum Extensions Challenge so we've been pondering what makes a great extension. Great browser extensions add functionality and fun to Firefox, but there's more to it than that. They're easy to use, easy to understand, and easy to find. If you're building an extension, Dustin Driver offers some simple steps to help it shine. The Quantum Extensions Challenge is running until April 15, 2018. Prizes will be awarded to the top extensions in three categories: Games & Entertainment, Dynamic Themes, and Tab Manager/Organizer. Enter today and keep making awesome extensions!

Artículo 309

Título: JavaScript to Rust and Back Again: A wasm-bindgen Tale
Resumen: Recently we've seen how WebAssembly is incredibly fast to compile, speeding up JS libraries, and generating even smaller binaries. We've even got a high-level plan for better interoperability between the Rust and JavaScript communities, as well as other web programming languages. The goal of wasm-bindgen is to provide a bridge between the types of JavaScript and Rust. It allows JS to call a Rust API with a string, or a Rust function to catch a JS exception. wasm-bindgen erases the impedance mismatch between WebAssembly and JavaScript, ensuring that JavaScript can invoke WebAssembly functions efficiently and without boilerplate, and that WebAssembly can do the same with JavaScript functions.

Artículo 330

Título: A rule-based framework to create dynamic themes
Resumen: One issue with dynamic theming API compared to traditional CSS theming is that it requires familiarity with JavaScript and WebExtension APIs to make a basic dynamic theme. To address this problem, I have experimented with a simple system that enables dynamic theming using simple theming "rules". A "rule" consists of a JavaScript condition string paired with a theme name. The boilerplate I've built takes care of the heavy-lifting needed by dynamic themes in order to set up WebExtension listeners, hooking with other APIs — to let you focus on the dynamic theming part.

Artículo 336
Título: Making WebAssembly even faster: Firefox's new streaming and tiering compiler
Resumen: People call WebAssembly a game changer because it makes it possible to run code on the web faster. Some speedups are already present, and some are yet to come. With streaming compilation, the browser compiles the code while the code is still being downloaded. Up until now, this was just a potential future speedup. But with the release of Firefox 58 next week, it becomes a reality. Firefox 58 also includes a new 2-tiered compiler. The new baseline compiler compiles code 10–15 times faster than the optimizing compiler. Combined, these two changes mean we compile code faster than it comes in from the network.

Título: A Classic Extension Reborn: Tree Style Tab

Resumen: Yuki "Piro" Hiroshi is a trailblazer and a true do-it-yourselfer. Whenever the Tokyo-based programmer gets irritated with any aspect of his browsing experience, he builds a workaround for himself and shares it with others. After authoring nearly 100 browser extensions, Piro recently took on his biggest challenge yet: migrating the legacy Tree Style Tab (TST) extension to work with the new WebExtensions API and Firefox Quantum.

Título: Intersection Observer comes to Firefox
Resumen: What do infinite scrolling, lazy loading, and online advertisements all have in common? They need to know about—and react to—the visibility of elements on a page! Unfortunately, knowing whether or not an element is visible has traditionally been difficult on the Web. Most solutions listen for scroll and resize events, then use DOM APIs like […]

Título: Inspect, Modify, and Debug React and Redux in Firefox with Add-ons
Resumen: React, along with Redux, is one of the fastest and most flexible UI frameworks on the web. It's easy to write, easy to use and is great for teams. However, it's not easy to debug them in the browser. Now, browser add-ons like React Developer Tools, Redux DevTools, and Vue let you inspect, modify, and debug your code right in the browser.

Artículo 381

Título: Optimizing Performance of A-Frame Scenes for Mobile Devices

Resumen: A-Frame makes building 3D and VR web applications easy, so developers of all skill levels can create rich and interactive virtual worlds. For an Oregon State University student project focused on WebVR, our team investigated performance and optimizations for A-Frame on Android smartphones. We developed a means of benchmarking the level of 3D complexity a mobile phone is capable of, and determining which performance metrics are required for such a benchmark.

Título: A Web for Everyone: Interviews with Web Practitioners — Fyrd
Resumen: In recent posts, we've explained why it's important to make the web work for everyone. We've spoken with several top web developers about how they do that. And in between, we've shown how browser makers can advance compatibility by adopting living standards. Today we'll show how a single individual can dramatically improve the tooling space, […]

Título: A WebAssembly Milestone: Experimental Support in Multiple Browsers
Resumen: WebAssembly is an emerging standard whose goal is to define a safe, portable, size- and load-time efficient binary compiler target which offers near-native performance—a virtual CPU for the Web. WebAssembly is being developed in a W3C Community Group (CG) whose members include Mozilla, Microsoft, Google and Apple. I'm excited to announce that WebAssembly has reached […]

Artículo 616
Título: WebRTC requires Perfect Forward Secrecy (PFS) starting in Firefox 38
Resumen: Today, we are announcing that Firefox 38 will take further measures to
secure users' communications by removing support in WebRTC for all DTLS cipher
suites that do not support forward secrecy. For developers: if you have a WebRTC
application or server that doesn't support PFS ciphers, you will need to update your
code. Forward secrecy, […]

Artículo 617
Título: Synchronous Execution and Filesystem Access in Emscripten
Resumen: Emscripten helps port C and C++ code to run on the Web. When doing such
porting, we have to work around limitations of the web platform, one of which is that
code must be asynchronous: you can't have long-running code on the Web, it must be
split up into events, because other important things – […]

Artículo 655
Título: Creating a mobile app from a simple HTML site
Resumen: This article is a simple tutorial designed to teach you some fundamental
skills for creating cross platform web applications. You will build a sample School Plan
app, which will provide a dynamic "app-like" experience across many different platforms
and work offline. It will use Apache Cordova and Mozilla's Brick web components. The
story behind the […]

Resumen: One question we get asked quite often about developing web applications using HTML5, CSS3, and JavaScript, is about how to conceal code. Reasons range from preventing cheating, protecting intellectual property, hiding encryption algorithms and others. Since JavaScript is executed on the client side, even on Firefox OS, the users can get access the code if […]

Artículo 810
Título: Introducing Brick: Minimal-markup Web Components for Faster App Development
Resumen: Those of you on the cutting HTML5 edge may have already heard of the exciting Web Components specification. If you haven't, you'll probably want to read up on what makes this so exciting, but long story short, Web Components promise to open up a new realm of development by letting web developers write custom, reusable […]

Artículo 812
Título: Localizing Firefox OS Apps
Resumen: Firefox OS Apps are being used around the world—Spain, Poland, Colombia
and Venezuela with many more countries coming—so it's important to consider
localizing your app from the beginning. But with the open web being as open as it is,
there are many frameworks and technologies to pick from when it comes to localization.
For example, […]

Artículo 849
Título: WebRTC comes to Firefox
Resumen: As we mentioned in the Hacks blog back in April , WebRTC will be on by
default in Firefox 22. getUserMedia (gUM) has been on by default since Firefox 20.
PeerConnection and DataChannel, which enable video/audio calling and peer-to-peer
data sharing, are what's new in Firefox 22 (due to be released today). WebRTC brings
real-time […]

Título: Hello Chrome, it's Firefox calling!

Resumen: Mozilla is excited to announce that we've achieved a major milestone in WebRTC development: WebRTC RTCPeerConnection interoperability between Firefox and Chrome. This effort was made possible because of the close collaboration between the open Web community and engineers from both Mozilla and Google. RTCPeerConnection (also known simply as PeerConnection or PC) interoperability means that developers […]

Resumen: Firefox for Android has expanded its HTML5 video capabilities to include H.264 video playback. Web developers have been using Adobe Flash to play H.264 video on Firefox for Android, but Adobe no longer supports Flash for Android. Mozilla needed a new solution, so Firefox now uses Android's "Stagefright" library to access hardware video decoders. The […]

Título: Codebender: physical programming on the web – a WebFWD project
Resumen: What is codebender? What problem does it solve? Whereas the cloud-based, software-as-a-service development has made it easy to develop by reading some tutorials and start hacking, physical computing is lacking far behind. This used to be in part due to the difficulty of designing hardware, but platforms such as the Arduino have made this a […]

Resumen: Change is coming to the Mozilla Developer Network! As you probably know, we've been using the MindTouch wiki software for several years now, and although it's a nice package, it has not been a good fit for us. As I hope you also already know, we've been working for the last couple of years on […]

Artículo 1124
Título: Doc sprint in [insert California cliché]
Resumen: The last weekend in April saw yet another amazingly productive documentation sprint for MDN. A group of community members gathered at the Mozilla spaces in California, while others contributed remotely. The in-person group worked on Friday in Mozilla's Mountain View headquarters, then spent Saturday and Sunday at the Mozilla space in San Francisco. Here is […]

Artículo 1406

Título: The European MDN access snafu
Resumen: Over the last couple of days, we had a problem come up that broke access to MDN documentation from Europe. I thought I'd share an explanation of what happened because it's a slightly interesting story, and our European users deserve to know. A few days ago, we started having a round of persistent spamming, with […]

Título: Firefox 4 beta 1 is here – what's in it for web developers?
Resumen: Today we're releasing the first beta-quality version of Firefox 4, which starts us down the path to a final release of Firefox 4. We're handling this beta differently than we've done other releases. In previous betas we've made milestone-like releases. For this beta we'll be making more frequent updates during the beta program. So if […]

Título: offline web applications
Resumen: The network is a key component of any web application, whether it is used to download JavaScript, CSS, and HTML source files and accompanying resources (images, videos, …) or to reach web services (XMLHttpRequest and <forms>). Yet having offline support for web applications can be very useful to users. Imagine, for example, a webmail application […]

Artículo 1571

Título: HTML5 drag and drop in Firefox 3.5

Resumen: This post is from Les Orchard, who works on Mozilla's web development team. Introduction Drag and drop is one of the most fundamental interactions afforded by graphical user interfaces. In one gesture, it allows users to pair the selection of an object with the execution of an action, often including a second object in the [...]

Artículo 1572

Título: elliptical borders in Firefox 3.5

Resumen: Today's demo comes from Lim Chee Aun, the creator of the Phoenity icons and themes, and web developer in Malaysia. The border-radius property is probably one of the most interesting parts of the CSS3 specification, where it allows you to create rounded corners on elements. For example: div { border-radius: 10px; -moz-border-radius: 10px; -webkit-border-radius: 10px; [...]

Artículo 1574

Título: css transforms: styling the web in two dimensions

Resumen: One feature that Firefox 3.5 adds to its CSS implementation is transform functions. These let you manipulate elements in two dimensional space by rotating, skewing, scaling, and translating them to alter their appearance. I've put together a

demo that shows how some of these functions work. There are four animating objects in this demo. Let's […]

Artículo 1615
Título: animating SVG with canvas and burst
Resumen: Today's demo is short, but it also includes a long screencast that describes how it's put together. The demo's author, Alistair MacDonald (@F1LT3R), is one of the maintainers of Processing.js and the Burst engine, which is the basis for today's demo and tutorial. If you haven't clicked through to his site, I strongly suggest that […]

Artículo 1616
Título: stylish text with text-shadow
Resumen: This post is from Frederic Wenzel, who works on Mozilla's Web Development team. The text-shadow CSS property does what the name implies: It lets you create a slightly blurred, slightly moved copy of text, which ends up looking somewhat like a real-world shadow. The text-shadow property was first introduced in CSS2, but as it was […]

Artículo 1617
Título: add some ambiance to your videos
Resumen: Note: this post was originally posted to the silverorange labs blog and was written by Mike Gauthier. Mike and other people at silverorange put this demo together

for the 35 days project and we thank them. Also note that the demo below is extremely CPU-intensive. If you're interested in the effect and you don't have […]

Artículo 1618
Título: geolocation in Firefox 3.5
Resumen: This post is from Doug Turner, one of the engineers who is behind the Geolocation support in Firefox 3.5. Location is all around us. As of this writing, I am in a coffee shop in Toronto, Canada. If I type google into the url bar, it takes me to www.google.ca, the Canadian version of Google, […]
